# **Rogue waves in UK coastal waters**

Investigating the nature and dynamical properties of rogue waves

Edward Roome (1<sup>st</sup> Year PhD student)

Supervisors: Prof. Simon Neill & Dr. Suzanna Ilic & Dr. David Christie

# Background

Rogue waves are windgenerated surface waves which are much larger than the background waves.

#### What is a rogue wave?

A wave whose maximum height exceeds twice the significant wave height  $(H_s \text{ or } H_{m0})$ :

 $\frac{H_{max}}{H_s} > 2$ 

#### Rogue waves are a marine hazard

Extreme heights, steep wave fronts, and groups - no accurate forecast

2005-2021 - (Didenkulova et al., 2022)

#### **Generation mechanisms?**

Linear superposition (dispersive focussing) vs. non-linear (modulation instability)\*

Linear dispersive focussing is thought to be dominant (Christou & Ewans, 2014; Fedele at al. 2016; Hafner et al. 2021; Teutsch & Weisse, 2023)

Sea state parameters  $\bigcirc$  rogue wave occurrence

#### In 1995, the first reliable measurement of a rogue wave was made – the Draupner wave.

\*Environmental factors e.g. Wave-current interaction

### **Past research**

### **Dataset – Channel Coastal Observatory**

Better understand coastal rogue waves (occurrence & generation mechanisms)

Distance offshore (km)

# Methodology

#### Preprocessing

Combine raw data into structured netCDF format

### 2

#### Processing

Complete wave-by-wave analysis and compute sea state statistics

# 3

#### Postprocessing

Filter waves

### 4

#### Analysis

Look for relationships between sea states and rogue waves

In progress...

Preprocessing

- 8.5 million .raw (30-min) displacement files (480 years)
- 9 million .spt spectra files
- 21% are incomplete
- 10% are missing

### Processing

- Wave-by-wave analysis (Free Ocean Wave Dataset processing tool - Hafner et al. 2021)
- Running window approach (10 min, 30 min, dynamic)

### Postprocessing

Filters:

- 1. Hs less than 1 m
- 2. Mean period less than 5 s (Nyquist frequency)

3. Relative energy of low frequency band exceeds 10% of the total energy

🔲 Waves removed (low swh) 📃 Waves removed (drifting) 🔤 Wave removed (undersampled) 🔲 Waves passed

1 in 15,000 (Hafner et al. 2021)

### **Temporal analysis**

### Analysis

Rogue Wave Probability 1e-4

- Probabilities vary by 2x
- Crest-to-trough correlation remains a strong predictor

Further analysis & write-up in progress... (full & filtered processed dataset will be published)

## **Challenges (1)**

High frequency radar transmission (from wave buoy to receiver) can result in missing data. **Solution:** These files with missing data are replaced with NaN values.

## **Challenges (2)**

A common issue with raw data from the Datawell Waverider buoys is the **filter artefact Solution:** We attempt to remove these data points in QC ... However, some remain in the processed data.

### **Progress timeline**

# An investigation of rogue waves in UK coastal waters (James & Panchang, 2025)

- Data spanned from 2014.01 2020.12
- Sea state parameters are calculated from the preceding 30-minute sample. Then the probability of a rogue wave occurring in the next sample is used.
- No wave-by-wave analysis
- Found 1 in 8,000 waves were rogue
- Found that relative depth is a strong predictor we did not find this to be true in our analysis.

#### Perranporth tidal test – ran a harmonic prediction from 30 model timeseries
